PitchIQ AI

Multi-Step Prompt Workflow for Startup Pitch Evaluation

Student Name	KOLA SRIKANTH
Register No.	99230040341
Assessment Type	Mini Assessment – Prompt Workflow Design

1. Project Objective

The objective of PitchIQ AI is to design a structured, multi-step prompt workflow that takes a startup problem statement and proposed pitch idea as input, evaluates the idea from multiple perspectives, strengthens its weaknesses, and produces a concise, investor-ready final pitch. The workflow demonstrates prompt chaining, where the output of one stage is deliberately passed as context to the next stage.

2. Problem Statement

Early-stage founders may have strong business ideas but often struggle to determine whether their concept is sufficiently original, technically feasible, financially viable, scalable, and clearly communicated to investors. A single AI prompt may produce a useful answer, but it does not provide a systematic evaluation process. PitchIQ AI addresses this by dividing the reasoning process into six clearly defined stages.

3. Workflow Architecture

4. Workflow Steps and Expected Outputs

STEP	PURPOSE	EXPECTED OUTPUT
1. Problem Understanding	Break down the problem statement, target customers, pain points, root causes, constraints and success criteria.	Structured problem analysis containing the core need, customers, constraints and expected outcome.
2. Pitch Analysis	Examine the proposed pitch idea against the problem and map features/benefits to customer needs.	Pitch assessment with features, strengths, customer journey and identified gaps.
3. Originality Evaluation	Assess uniqueness, differentiation and potential originality of the proposed business approach.	Originality score (1–10), USP, differentiation opportunities and improvement suggestions.
4. Viability & Market Impact	Evaluate technology, cost, complexity, scalability, market adoption and real-world impact.	Viability and impact scorecard with risks and mitigation strategies.

5. Pitch Refinement	Strengthen the original idea while preserving its fundamental purpose.	Improved pitch concept with enhanced features, positioning, scalability and business model.
6. Final Pitch Deck Generator	Combine all validated findings into a concise investor-facing pitch.	Final proposal containing USP, business model, impact, score and a 60-second pitch.

5. Detailed Prompt Design

Step 1 — Problem Understanding

Analyze the provided startup problem statement. Identify the core problem, target customers or beneficiaries, current challenges, root causes, constraints, expected outcome, and key requirements that a successful pitch should satisfy. Do not propose a solution yet. Return the analysis using clear headings and concise bullet points.

Step 2 — Proposed Pitch Analysis

Using the problem analysis from the previous step, evaluate the proposed startup pitch. Explain how it addresses the core problem, identify target customers, main features, customer journey, feature-to-problem mapping, strengths, and missing components. Do not completely redesign the pitch at this stage; focus on evaluating the existing proposal.

Step 3 — Originality & Uniqueness Evaluation

Evaluate the proposed pitch for originality and uniqueness. Identify its innovative aspects, features that are common or replaceable, unique value proposition, and opportunities for differentiation. Suggest three specific improvements that could increase novelty and provide an originality score from 1–10 with justification. Avoid unsupported claims about competitors.

Step 4 — Viability & Market Impact Assessment

Evaluate the pitch across technical feasibility, implementation complexity, cost feasibility, scalability, real-world market impact, customer adoption potential, and sustainability. Give each category a score from 1–10 with a concise justification. Calculate an overall score out of 10. Identify the three biggest implementation risks and one mitigation strategy for each.

Step 5 — Pitch Refinement

Improve the proposed startup pitch using the previous evaluations. Preserve the fundamental purpose while strengthening originality, technical feasibility, scalability and customer experience. Provide an improved concept, five improved features, new differentiating elements, expected impact, and explain how the revised pitch addresses earlier weaknesses.

Step 6 — Final Investor Pitch Generator

Using all previous analyses, generate the final investor-ready proposal. Include: project title, one-line problem statement, proposed solution, target customers, key features, originality/USP, technology approach, implementation approach, expected impact, scalability, risks and mitigations, overall evaluation score, and a persuasive 60-second pitch. Do not invent facts, statistics, partnerships or achievements.

6. Prompt Chaining & Information Flow

The workflow is designed so that each stage builds on verified context from earlier stages. Step 1 creates the problem analysis; Step 2 consumes that analysis to evaluate the pitch; Steps 3 and 4 use the pitch analysis to score originality, viability and impact; Step 5 uses those findings to refine the concept; and Step 6 consolidates

the refined concept into the final pitch. This makes the workflow reproducible, traceable and more reliable than a single broad prompt.

7. Demonstration Example

Input Problem: Small local retailers often struggle to manage inventory efficiently, leading to stockouts, overstocking and lost sales. Limited access to affordable analytics tools makes it difficult for them to forecast demand accurately. Develop an AI-powered solution that helps small retailers optimize inventory and improve sales forecasting.

Proposed Pitch: StockSense AI is a mobile and web-based assistant that analyzes point-of-sale data using machine learning to forecast demand and provides retailers with automated restocking recommendations.

Expected Final Result: After the six stages, the system should produce an evaluated and refined StockSense AI concept with a clear USP, technology approach, impact assessment, viability score, risk mitigation plan and a concise investor-facing pitch.

8. Expected Learning Outcome

This workflow demonstrates how prompt engineering can be used to decompose a complex task into manageable AI interactions. It highlights sequential prompting, contextual reuse, structured outputs, evaluation criteria, iterative improvement and final content generation—all without requiring software development or code.

9. Conclusion

PitchIQ AI transforms an initial startup concept into a structured, evaluated and pitch-ready proposal through six connected prompt stages. By separating problem understanding, pitch analysis, originality assessment, viability evaluation, refinement and final communication, the workflow provides a clear and professional approach to AI-assisted startup pitch preparation.
